Task 3 - Define the Constants

C Programming Assignment - Rural Electricity Billing System

Macros, const and enum

#define RATE2_PAISE 230LL is a preprocessor substitution without type checking. const long long rate = 230LL is a typed read-only object. enum is useful for named categories and status codes.

Example

#define RATE2_PAISE 230LL

#define DEBUG 0

enum CustomerCategory { DOMESTIC, FARM, SMALL_BUSINESS };

static const long long FIXED_CHARGE_PAISE = 5000LL;

Tariff revisions

Change a compile-time macro in one place and rebuild. If rates must change without recompilation, load them from a validated configuration file at runtime.

Best practice

Use uppercase names for macros, descriptive names for variables and include guards in headers. Avoid duplicating tariff values throughout the program.

Important: illustrative tariff rates are used because the screenshot does not show the complete official tariff table. Replace them with your instructor's prescribed rates.
